***Headline:** Seismic forecast is on the way to be realised. Thanks to a major cosmic fact: the planet Vulcan and its orbital position shows interdependence with other celestial bodies, as departing factor to the release mechanism of influence on earth tensions resulting in earthquakes.*

ABSTRACT: End of 2004, the tsunami pictures have been an electroshock for those who question about the possibility to forecast earthquakes. Interdisciplinary sciences pressed on with researching possible links, by applying the universal laws of correspondance and analogy. Accordingly, geophysical research can be completed by a research on the solar system influence. But recognising the existence of the smallest planetary body called Vulcan is necessary. As well as its forces, that enable to resonate within the earth. This should give another vision to the interdependence of energies within the universe, and consequently their interactions. A different approach of astrological calculations, with a scientific and statistic view enables to understand how cosmic energies work up to a seismic event.

INTRODUCTION

On December 26, 2004 a tsunami devastated the coasts of many countries framing the Indian Ocean. It resulted from an earthquake, which focus was about 150 km off the west coast of Northern Sumatra, with a seismic moment and magnitude of 9.0 on the Richter scala. One of the four strongest earthquakes in intensity, since measurements are possible.

On TV plateaus, most of the scientists answered the medias to the numerous questions, except one. How come no relationship had been made with another earthquake three days before?

With a magnitude of 8.1 on the Richter scala, the event could certainly have been of equal importance in terms of human and material destructions, if it would have happened near inhabited places. But the location was far enough in the Southern

Pacific Ocean, in the area of the Macquarie Islands. In fact, no scientist spoke of the event publicly. Today, they would state that there was no link at all between both earthquakes at an interval of 3 days. Because, tectonically, the plates and faults are not in close relation.

Now, it is possible to assert that the link existed. Thanks to a major cosmic fact and a new astrological system of analysis. Hopefully, this will eventually give its scientific credit to astrology, as medium to forecast earthquakes.

THE INFLUENCE OF PLANET VULCAN

True scientific astrology says – but astrologists do not use this element so far – that planet Vulcan has a major influence on the cause of earthquakes. It is now confirmed. Unfortunately, the existence of this planetary body has no credit among the astro-

physicists. The hypothesis of Vulcan's existence has been thrown away, after Einstein demonstrated in 1916, with his theory of general relativity, the measure of the precession movement to the planet Mercury, explaining why the orbit of the latter was so uncertain and irregular. Therefore, it became impossible to consider Vulcan as a planetary body, for being too close to Mercury. Then, even though some unsuccessful research onboard Skylab in the 70's, the interest to observe Vulcan remained mostly absent. Why? Its size is small, its position close to the Sun refrains from visibility, except at eclipse times, and the calculation of its orbit is as risky as the one of the planet Mercury, due most probably to the strong magnetic field of the Sun and different gravitational movements. But the planet Vulcan has been observed before... In the 19th century by two French astronomers. And in very ancient times by the Etruscans, and their predecessors in various civilizations, who use to worship the sacred god Vulcan, father of the underworld fire activities and volcanoes. In those times, they also perfectly knew the difference between Vulcan and the farthest orbiting planet Pluto, god of death and hell. They knew that those bodies work as a couple of polarities of a same force, which together develop a tremendous energy, inversely proportional to their so little size.

Today, the facts are there. The cosmic role of planet Vulcan on earth matter must be taken into account in every serious astrological survey aimed at seismic forecast. It is statistically proved that the importance of Vulcan, coupled with other planetary influences «prepare» the earthquake, before reaching a paroxysmic intensity, that releases the triggering energy of large scale destruction.

A scientific astrological global study will also consider other factors, in order to reach the highest degree possible of reliability, in forecasting such events that happen every day with more or less intensity. Besides the evident role of Vulcan, the main factor – new – will be the calculation of superimposed triangular planet aspects, and their altogether relations. The next, being the number of

links departing from Vulcan. It has been observed that for most of the strongest earthquakes in the 20th century – of magnitude 8.0 and more – the triangular relation starting from Vulcan, usually begins 3 to 4 days before the earthquake itself, sometimes 5 days, to one week before. A kind of energetic gap inbetween those days of «preparation» is also observed – usually one to two days before the event – that needs to be carefully analysed and coupled to the study of the daily path of the Moon. During a «preparation phase», the configuration of links starting from Vulcan varies from 3 to 9, and can reach up to 16 on D-Day.

Of course, Planet Vulcan is not the only one to be involved in earthquake energetic influences: other major «departing» planets are those called in astrology external planets, Pluto, Neptune and Uranus. The latter being very central in the dispatching of energies within the triangular linking, as it is a planet of synthesis. Observations show that Uranus often is not a «departing» relation, but works into two distinct ways. First, as revelator of the above mentioned major planetary influences with their own qualities. And secondly, as propeller of the sudden destructive energy.

Coupled with Neptune conjunct (1° to 4° of arc), in opposition (180° of arc), in square (90° of arc) or in quincunx (150°), the destructive aspect of Uranus is very deep and lasting. Coupled with Mars, Uranus increases its force, more specifically in squares. But the most powerful destructive energy factor is with no doubt the association of Vulcan and Uranus conjunct, or Vulcan and Pluto together, as it happened on December 26, 2004.

In the old Vedic Scriptures of India, Neptune, Uranus and Saturn tend to the synthesis of higher cosmic energies, under the god Varuna, who represents the Cosmic Ocean, the broadest and purest principle of beingness, as well as the guardian of The Truth, destroying all kinds of enemies resisting his divine energies. This symbolical way of describing the cosmic influence is clear enough to show the power of the polarized couple Neptune-

Uranus as highly powerful energies in the solar system, to which has to be added the polarized couple Vulcan-Pluto.

If we consider the conscious power of planetary bodies involved in the interactive energetic organisation of an earthquake, and translate it into scientific keywords, we find therefore: Vulcan, as will and power of decision, which means the seismic momentum. Pluto represents the deep transformation by means of lethal destruction. Neptune is the choice of the frequency. And Uranus, the amplitude of the chosen frequency. Mars is the strenght of the whole event. Saturne is the conscious action, that resonate into human experience. As for the Moon – an important actor to be considered – it is but the reflection of the above mentioned planets. It has no power of its own. Because it does not transmit any self-radiation. Closely related to one or more planets in the daily configuration of tension aspects (2 planetary bodies of the solar system linked by a specific gradient), it relays and increases their destructive power during a seismic event. Its precise position in the chart indicates how the external planets will transmit their influence onto the earth, and how it will modify the daily relations.

As the planets are located far enough from the earth, in the chart calculation it is accepted that the angles are not always exact in forming the tension aspects. Though the more exact, the more obviously acting on earth. With 1° to 4° on each side of the exact aspect (for example a square = 86° to 94° of arc) the sphere of influence of the aspect, coupled with the distance in the universe, is always strong enough to allow the prediction. Where Vulcan is involved, things are a little different. The allowance is more precise in case of direct relations, and usually does not overcome 1° to 3° of arc, except in clusterums (conjunctions of more than 2 planets), where 4° of arc difference is accepted. This is due to the solar magnetic field.

When Vulcan is aspected with the Moon, it must be exact, as the Moon orbit is so rapid around the Earth. The whole chart can show energetic influ-

ences, that last a couple of hours before the seismic destruction starts. This latency period depends on all the aspects related to the external planets (Pluto, Neptune, Uranus), as well as the the number of triangular relations that «organise» the power of destruction. It is very important to compare the four previous days, as well as considering the path and the phases of the Moon. The difficulty of the continuous daily forecast can be alleviated by a discriminating analysis of the Moon position and the links made with other planets within a particular period.

TRIANGULAR RELATIONS

In order to forecast properly, it is important to analyse the relation carefully (the relation is the whole of aspects linked together during a given day or period). The first element to observe is how the cosmic energy is «entering» into the field and atmosphere of the earth. Not many are the possibilities: the first type of relation is linear. The second is a loop relation. Both can be coupled in the same chart, or can work separatedly. But there is also the possibility to observe a loop relation, attached to a linear relation. Or a small loop (simple triangle) into a bigger loop relation. Another possibility is also two linear relations. In one day, not more than 1 to 3 separate relations are observed. Often in the case of seismic events of magnitude 6.0 and more, it has been observed that 2 separate relations can be joined into one, only by the fact of the movement of the Moon, creating a new aspect with a major planet at a certain time.

Superimposed triangles show the percentage of energetic occupation in a chart. It changes day after day. In the example of the Chile earthquake on May 22, 1960, the energetic occupation on the chart was 100%, with 3 superimposed triangles, one double loop relation with 6 aspects, starting from Vulcan, coupled directly with Pluto (square with a difference of $03'$ of arc), plus inside a small loop starting from Pluto, another loop of 3 aspects, departing from Uranus. For a total of 9 aspects.

Three triangles were centered in the chart on D-Day. This means a strong energy going through the aspect lines framing the focus seismic point. The preceding days, the triangles were always 3, on the same 100% of occupation in the chart. This configuration, with some small aspect modifications, lasted 6 days before the earthquake, which is rare. This was obviously announcing a very powerful event.

Another element to take into account is the location of the triangles towards the chart centre. For it represents the center of the earth. Therefore, centered triangle(s) seem to amplify the entering cosmic energy into the earth. Graphically, we have a very interesting analogy between the astrological seismic survey and the trajectory of the seismic primary and secondary waves in the inner globe.

The «preparation» of the Sumatra earthquake (26.12.2004) started on December 22. Astronomically, we know that the energies of the solstice have a strong reflection on Earth, like the great ocean tides. That day, planet Vulcan began its conjunction with Pluto with a difference of $1^{\circ}47'$ of arc. Neptune was square to Moon, the latter being an exact quincunx (150°) at 23h UMT, to Vulcan-Pluto. With a total of 4 triangles. On December 23th, the conjunction Vulcan-Pluto had a difference of arc of $1^{\circ}08'$, with 3 relations, which the opposition of Moon to Mars, square to Uranus, created the figure that activated the seismic oscillations in the Macquarie area, south of New Zealand. On December 24th at 0h UMT, the links occupation on the chart showed an important expansion of the aspected energies. Vulcan-Pluto were conjunct with an arc of $26^{\circ}30''$. It started a double loop relation with 8 aspects and 8 planets. That day at 13h45 UMT, the conjunction of Vulcan-Pluto was exact. The Moon was in opposition to Mercury-Venus conjunct, aspected to Neptune by a sextile (60°). On December 25th, the Moon was opposed to Vulcan-Pluto at 14h30 UMT, with a global relation of 4 triangles, 13 aspects in 2 loops, and 1 linear relation, for a total of 11 planets involved (in astrology, the luminaries

– Sun and Moon – are also called planets).

From this moment up to the time of the Sumatra earthquake itself (0h58 UMT on December 26th, 2004), the whole energetic influences increased like a big inflating balloon during more than 10 hours ($10h\ 28'\ 50''$ precisely). During this period of full moon – when the impact of energies on earth are increased manifold –, its path went from a first opposition to Vulcan-Pluto conjunct, to a second opposition to the Sun. All were connected to the strong destructive square between Uranus and Mars. The whole picture showed a total of 14 relations and 11 planets in 5 triangles, which 3 were centered. An apparent stabilisation of the event intervened only after 2 days, when the Moon strong aspects of opposition went over.

But it remained other aspects – those that last longer with external distant planets – before they dissolved, which made high amplitude oscillations repeat an important number of aftershocks of magnitude 6.0 and more, for a period of more than 15 days. This long time of energetic destabilisation, noticeable in astrological studies, is perhaps one further element to explain the forces involved globally, during this seismic event.

AN EXAMPLE OF FORECAST

To support the above observations, a concrete example of analysis will be given: we observe that the period between September 11th to September 14th, 2006 should be quite active. On September 11th is observed 3 relations of 11 aspects. At 19h UMT the Moon opposed to Jupiter, is joining two triangles into 1 relation. Another opposition between Neptune and Saturn is noted. Both draw together in the sky a great cross, announcing much tension. On September 12th, the relations are two, and become one at about 10h UMT, when the Moon creates a new triangle with Vulcan and Pluto. For a total number of aspects of nine during the day. On September 13th, 3 relations of 10 aspects are noticed in 2 loops. The peak of tension is situated between 16h and 21h UMT. On September 14th, we observe a unique linear rela-

tion of 9 aspects. This figures out a great tension (in a graphic form of a lightning flash), that could be released at any time of the day, but more specifically between 14h and 18h, when the Moon, in phase of quarter is reaching Pluto in an aspect of opposition (180°). With a probability of activity with a magnitude between 6.0 and 7.0.

The location of an earthquake is more difficult to predict, except if a careful study is made out of the statistics, showed by the registration from the worldwide seismic stations, considering latitude belts and magnetic resonance of past events.

RESULTS

Astrological results enable to preview and prevent seismic catastrophies with due respect to Mother Nature's suddenness. Mathematical calculations could synthetise both, geophysical and astrological data, in order to find a new model of approaching the prediction of earthquakes. Some scientists have observed the ionosphere and the amount of electronic discharge at the right seismic moment.

It is quite interesting, but not enough. We must go further into the solar system, in a global observation of our space neighbourhood, and accept to merge all data possible with a wise vision.

A careful energetic analysis of each case must be done. With a high potential of discrimination, regarding the interdependence of the energies in cause. Aiming at the global vision, it may bring us to seek better understanding of the biosphere's life as a living conscious entity, considering that it is but a part of the solar system, the galactical system, the universe. All parts are interdependent, energetically. And those linking energies have in common the astrological science. Why? Astrology is the only science that synthesise two types of observations: inner and outer. Inner, from the point of view of the conscious lives within the whole universe. and outer, from the human point of view. And not the reverse. The links, being magnetic aspects, that still have to be studied within the field of the universal conscience. They influence Life as a whole, and enable the cohesion and the order, out of the

chaos.

The difference between planets, as astrophysical or astrological objects, has to be pointed out. Science recognises only celestial objects for their own, and separatedly. While true astrology uses each body (planet, star, constellation, system) as living intelligence and element of a greater globality – each one with an expanding conscience –, where location, dimension, position and action within the universe are related altogether. Those relations are but the conscious links at the source of interdependent energetic actions, translated by the human point of view throughout ageless wisdom.

The fact that astronomical and astrological positions do not concord is explained by the strong human mental power that registers the Zodiacal representation as a fixed circle. But again, true scientific astrology knows that all is moving at all times, and the precession of equinoxes is helping fixing the constellations within the universe, reflecting their true position in our minds as a certain space/time, that opens to more consciousness, and better understanding of the universal cycles. Science also works with mind representations and images. It is the main human possibility to advance in terms of evolution. To enable working out the controversy, science must admit that conscience and wisdom confer many levels of proofs, based on real observations.

With the results of this study, a new door of cooperation may open. Therefore, there is no more obstacle to establish a gentleman's agreement and start to work together!

In conclusion, we must keep in mind that astrology is a real science, though the opportunity of forecasting earthquakes is of no evidence for those who follow the path of ordinary personal and individual prediction. The author is ready to cooperate with any scientific team, open to go further into this research, as prevention programme to save populations, and for the whole one humanity.

Morges, August 30th, 2006

Table 1. Most prominent astrological tension aspects involved in a seismic event in comparison to 5 days (4 previous days + D-Day) for 18 major earthquakes, with magnitude ≥ 8.0 : planet Vulcan is directly involved in 66,6% of the 12 major relations on D-Day.

D-Day	Total of 5 days
1) Neptune – Uranus	1) Neptune – Uranus
2) Vulcan – Pluto	2) Vulcan – Pluto
3) Vulcan – Saturn	3) Pluto – Mars
4) Vulcan – Moon	4) Vulcan – Saturn
5) Vulcan – Jupiter	5) Vulcan – Mars
6) Vulcan – Mars	6) Vulcan – Jupiter
7) Pluto – Uranus	7) Vulcan – Uranus
8) Pluto- Mars	8) Neptune – Mars
9) Neptune – Mars	9) Pluto – Uranus
10) Vulcan – Neptune	10) Neptune – Sun
11) Vulcan – Uranus	11) Pluto – Sun
12) Vulcan – Sun	12) Vulcan – Sun

Table 2. Number of tension aspects during 5 days, compared to the day of earthquake (18 major earthquakes, with magnitude ≥ 8.0): the conjunctions are a major factor of release mechanism in the seismic event.

D-Day	Total of 5 days
1) Squares: 32 = 177% = + 16%	1) Squares: 145 = 161 %
2) Quincunx: 30 = 166 % = + 6%	2) Quincunx: 144 = 160 %
3) Conjunctions*: 23 = + 27%	3) Conjunctions*: 90 = 100 %
4) Oppositions: 17 = 94% = + 8,5%	4) Oppositions: 77 = 85,5%

* Conjunctions between 2 planets. No mention of the clusterums (3 ore more planets.)

NOTES

For the study, the following data have been used:

A) Astrological data source come from the International Astronomical Union and the U.S. Naval Observatory. Those ephemeris are officially in use in U.S. Government astronomical almanacs.

B) Astrological data of planet Vulcan have been manually calculated, after the above official data (see A).

C) Seismic data source come from the European Mediterranean Seismological Centre (EMSC), and the Swiss Seismological Service, Swiss Technology Institute, Zurich, Department of Geophysics (ETHZ).
